1 Purpose and scope

This document describes the improvements and changes of ADD V3.6 compared to V3.5.

2 What's new in Version V3.6?

2.1 Highlights

2.1.1 Performance Improvements

The second step in improving the performance was made especially for search data types, search data objects, open a container and reorder action parameter (lazy commit).

2.2 New Features, Major Improvements

2.3 Minor Improvements / Correction of Bugs

2.3.1 Data Types with Wrong Resolution

Only relevant for configurations without SplitDatatype

When data types with a wrong resolution are already referenced, changes are no longer possible. As a workaround a data type admin can change the state of the wrong data type to "obsolete" and create the same data type again with the right resolution. In this case creating a second data type with the same name is possible. A new entry in the database for the linear conversion will be created with the new resolution.

2.3.2 Data Object Commit Interface

A combination of enum values can be specified to configure the data object Commit behaviour (see ADDCore API documentation).

3 No longer supported features

4 Questions?
